3/39

- Consider a strategic game  $\Gamma = (A_1, \ldots, A_n, u_1, \ldots, u_n)$ 
  - PNE are defined as the fix point among mutually best responses.

э

4/39

イロト イヨト イヨト

Consider a strategic game  $\Gamma = (A_1, \ldots, A_n, u_1, \ldots, u_n)$ 

- PNE are defined as the fix point among mutually best responses.
- It seems natural to consider variants of the process of local changes to try to get a PNE.

э

Consider a strategic game  $\Gamma = (A_1, \ldots, A_n, u_1, \ldots, u_n)$ 

- PNE are defined as the fix point among mutually best responses.
- It seems natural to consider variants of the process of local changes to try to get a PNE.
- Consider the algorithm:
  - choose  $s \in A_1 \times \cdots \times A_n$
  - while s is not a NE do choose  $i \in \{1, ..., n\}$  such that  $s_i \notin BR(s_{-i})$ Set  $s_i$  to be an action in  $BR(s_{-i})$
- The process looks similar to local search algorithms. Is there any difference?

イロト 不得 トイヨト イヨト 二日

### Best response graph

- The Nash dynamics or Best response graph has
  - $V = A_1 \times \cdots \times A_n$
  - An edge  $(s, (s_{-i}, s'_i))$  for  $i \in N$ ,  $s_i \notin BR(s_{-i})$  and  $s'_i \in BR(s_{-i})$ .
- Performing local search on the best response graph
  - Does it produce a PNE?
  - If so, how much time?
  - Let's look to some examples.

5/39

## Other games

- sending from *s* to *t*?
- congestion games?

In those games we cannot get the best response graph in polynomial time. However we can perform a local improvement step in polynomial time. Although, even assuring convergence, it might take exponential time to reach a NE.

## Best response graph: properties

- A NE is a sink (a node with out-degree 0) in the best response graph.
- The existence of a cycle in the best response graph does not rule out the existence of a PNE.
- If the best response graph is acyclic, the game has a PNE.

## Best response graph: properties

- A NE is a sink (a node with out-degree 0) in the best response graph.
- The existence of a cycle in the best response graph does not rule out the existence of a PNE.
- If the best response graph is acyclic, the game has a PNE.
   Furthermore, best response dynamics converges to a PNE, maybe with a lot of time.

### Network congestion games

- A network congestion game is a congestion game defined by a directed graph G and a collection of pairs of vertices  $(s_i, t_i)$ .
  - The set of resources are the arcs in G.
  - The acrions, for player *i*, are the  $s_i \rightarrow t_i$  paths on *G*.
- A network congestion game is symmetric when  $s_i = s$  and  $t_i = t$ , for  $i \in N$ .

### Results on convergence time

### Theorem (Fabrikant, Papadimitriou, Talwar (STOC 04))

There exist network congestion games with an initial strategy profile from which all better response sequences have exponential length.

### Results on convergence time

### Theorem (Fabrikant, Papadimitriou, Talwar (STOC 04))

There exist network congestion games with an initial strategy profile from which all better response sequences have exponential length.

### Theorem (leong, McGrew, Nudelman, Shoham, Sun (AAAI 05))

In singleton congestion games all best response sequences have length at most  $n^2 m$ .

#### Complexity classification?

AG		

# Optimization problem

An optimization problem is a structure  $\Pi = (I, sol, m, goal)$ , where

- C is the input set to  $\Pi$ ;
- sol(x) is the set of feasible solutions for an input x.
- m is an integer measure defined over pairs (x, y), x ∈ I and y ∈ sol(x).
- goal is the optimization criterium MAX or MIN.

An optimization problem is a function problem whose goal, with respect to an instance x, is to find an optimum solution, that is, a feasible solution y such that

$$y = \operatorname{goal}\{(m(x, y') \mid y' \in \operatorname{sol}(x)\}.$$

**Example**: Given a graph and two vertices, obtain a path joining them with minimum length.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● ● ●

- A local search problem is an optimization problem with
- A neighborhood structure is defined on the solution set  $\mathcal{N}(sol(x))$ .

A local search problems belongs to PLS (Polynomial Local Search) if polynomial time algorithms exist for

- finding initial feasible solution  $s \in sol(x)$ ,
- computing the objective measure m(x, y),
- checking whether a solution is a local optimum and if not finding a better solution in the neighborhood.

### **PLS** reductions

### A PLS reduction from $(\Pi_1,\mathcal{N}_1)$ to $(\Pi_1,\mathcal{N}_1)$ is

- a polynomial time computable function  $f: I_{\Pi_1} \rightarrow I_{\Pi_2}$  and
- a polynomial time computable function  $g: {
  m sol}(f(x)) o {
  m sol}(x)$ , for  $x \in {
  m I}_{\Pi_1}$  such that
- if  $s_2 \in sol(f(x))$  locally optimal then  $g(s_2)$  is locally optimal.

## PLS reductions

- A PLS reduction from  $(\Pi_1, \mathcal{N}_1)$  to  $(\Pi_1, \mathcal{N}_1)$  is
  - a polynomial time computable function  $f: I_{\Pi_1} \rightarrow I_{\Pi_2}$  and
  - a polynomial time computable function  $g : sol(f(x)) \rightarrow sol(x)$ , for  $x \in I_{\Pi_1}$  such that
  - if  $s_2 \in sol(f(x))$  locally optimal then  $g(s_2)$  is locally optimal.
  - If a local opt.of  $\Pi_2$  is easy to find then a local opt.of  $\Pi_1$  is easy to find.
  - If a local opt.of  $\Pi_1$  is hard to find then a local opt.of  $\Pi_2$  is hard to find.

A PLS problem  $(\Pi, \mathcal{N})$  is PLS-complete if every problem in PLS is PLS-reducible to  $(\Pi, \mathcal{N})$ .

## PLS complete problems

### • MAX-SAT (maximum satisfiability) problem

- Given a Boolean formula in conjunctive normal form with a positive integer weight for each clause.
- A solution is an assignment of the value 0 or 1 to all variables.
- Its weight, to be maximized, is the sum of the weights of all satisfied clauses.
- As neighborhood consider the Flip-neighborhood, where two assignments are neighbors if one can be obtained from the other by flipping the value of a single variable.

## PLS complete problems

#### MaxCut problem.

- Given a graph G = (V, E) with non-negative edge weights.
- A feasible solution is a partition of V into two sets A and B.
- The objective is to maximize the weight of the edges between the two sets A and B.
- In the Flip-neighborhood two solutions are neighbors if one can be obtained from the other by moving a single vertex from one set to the other.

#### Theorem

### Computing a PNE in congestion games is PLS-complete.
