Contents

- Motivation
- Agents and Norms
 - Agent view
- eOrganizations and Norms
 - The **HARMONIA** framework
- Conclusions, Ongoing and Future Work

Motivation

Motivation (I)

- Open multi-agent systems (MAS) have to cope with several issues
 - Heterogeneity among members
 - Communication
 - Participants' trust
- } • *Coordination*
• *Cooperation*

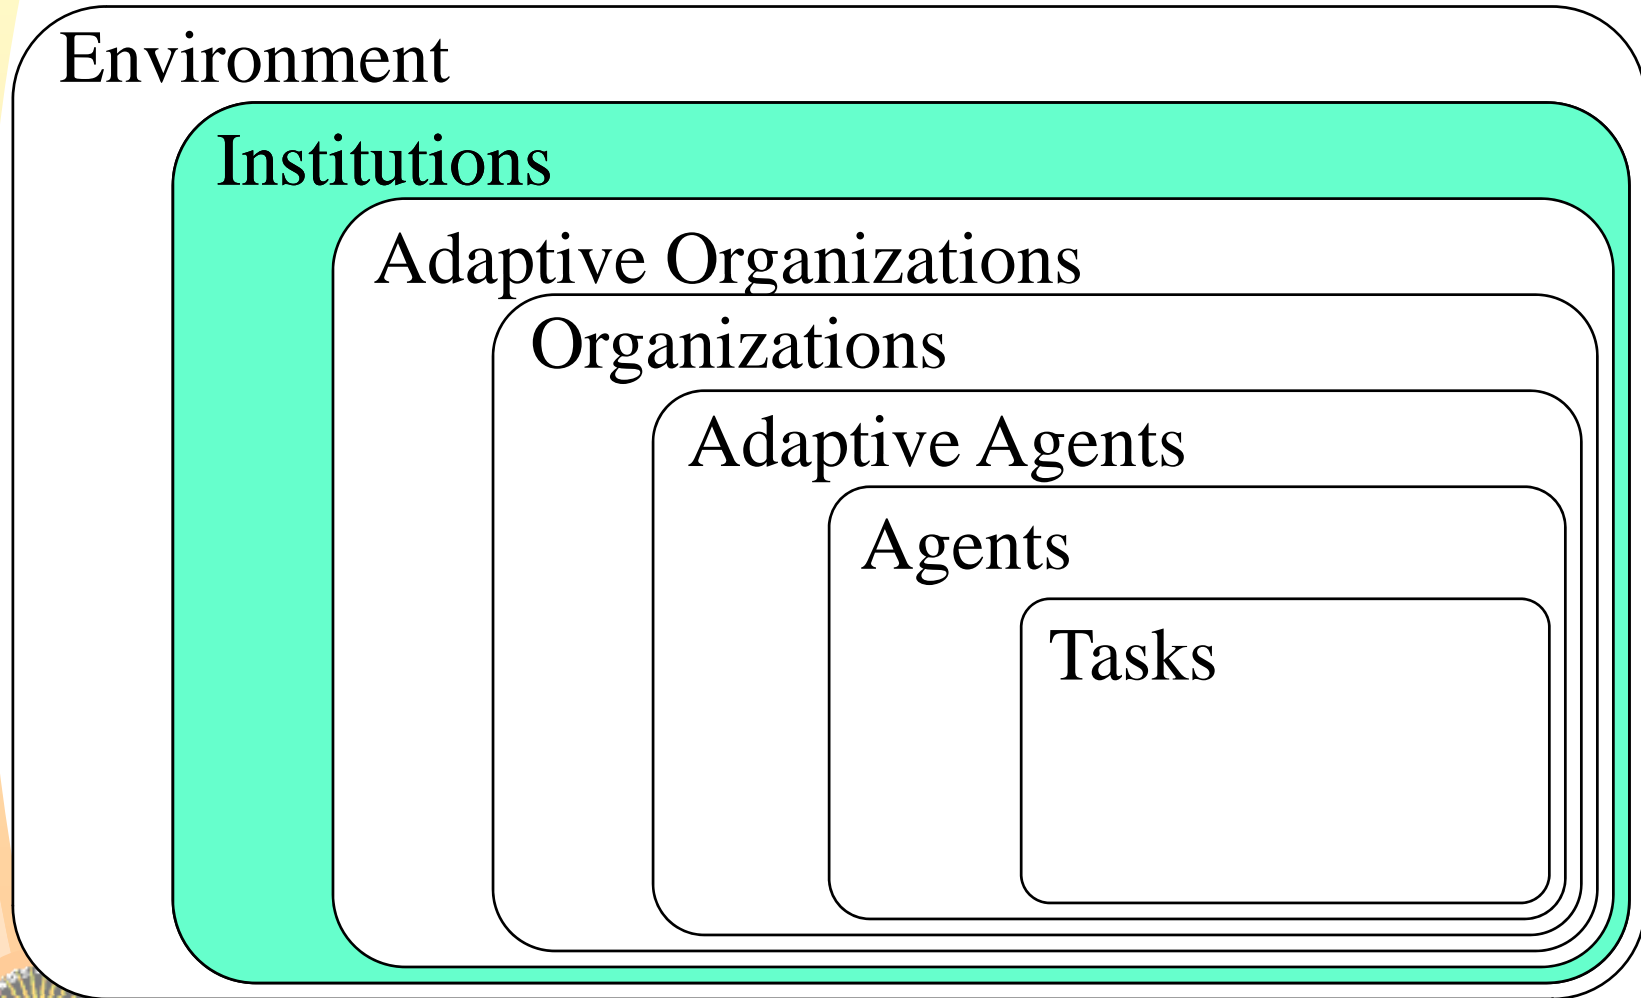

– Agent **Autonomy VS Control**

- Idea: multi-agent design can benefit from social abstractions
 - Study the problem from the societal and the individual points of view.

Motivation (II)

From individual to social view

Motivation (III)

Society's View

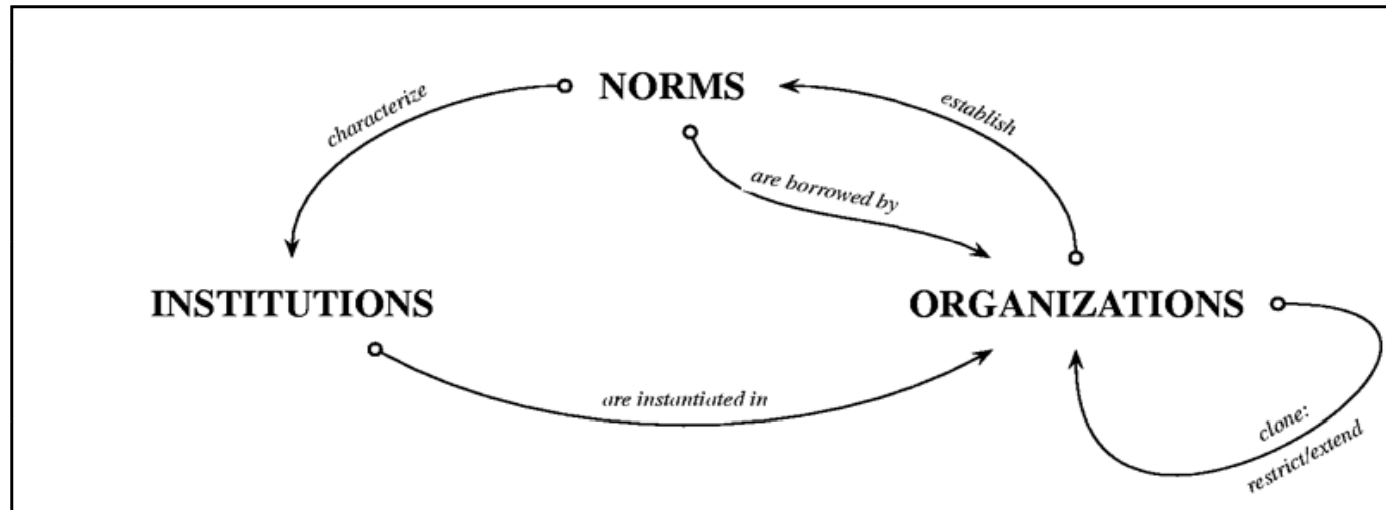

- **Social Structures** define a social level to enhance coordination by means of *interaction patterns*
- **Institutions** are a kind of social structure where a corpora of constraints (the *institution*) shape the behaviour of the members of a group (the *organization*)
- An **e-Institution** is the computational model of an institution through the specification of its *norms* in (some) suitable formalism(s). In the context of MAS they:
 - reduce uncertainty of other agents' behaviour
 - reduce misunderstanding in interaction
 - allows agents to foresee the outcome of an interaction
 - simplify the decision-making (reduce the possible actions)

- Agent **behaviour guided by Norms**

Motivation (IV)

Electronic Institutions?

- Most authors use the term **e-Institution** to refer to a multi-agent system following an institutional framework, but:

- From now on we will talk about **e-Organizations** following institutional patterns

Motivation (V)

Agent View

- Norms should guide the behaviour of the Agent
- **Problems:**
 - Norms are more abstract than the procedures
 - Norms do not have operational semantics

Example:

Regulation: “It is forbidden to discriminate potential recipients of an organ based on their age (race, religion,...)”

Formal norm: $F(\text{discriminate}(x,y,\text{age}))$

Procedure: does not contain action “discriminate”

Motivation (VI)

Application in a highly regulated *eHealth* environment

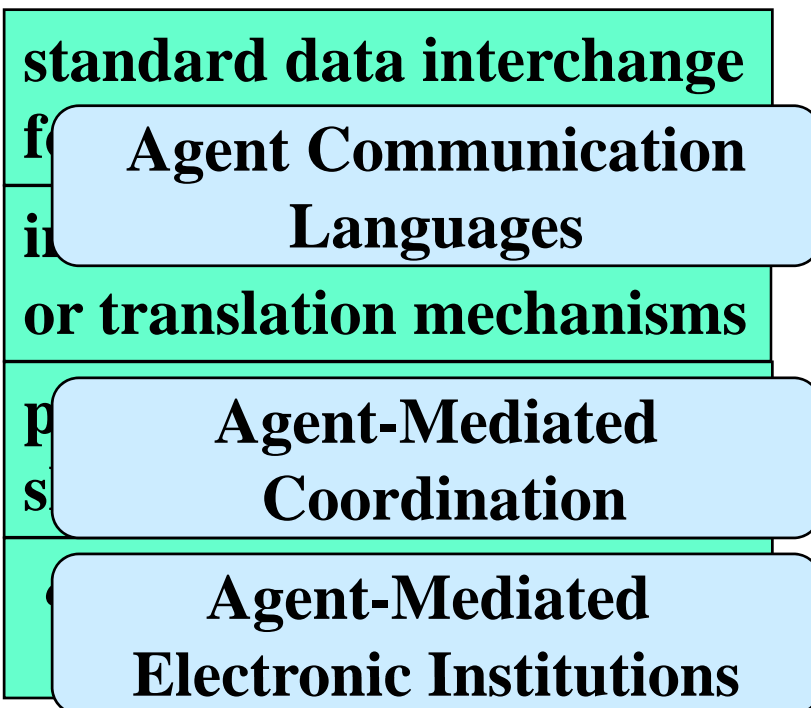

- *CARREL*: a project on distributed organ and tissue allocation.
- 2 kinds of transplants:
 - organs
 - You can not conserve them on banks
 - Every new organ donation → (manual) search for the recipient
 - tissues
 - You can keep them on banks, (not very long)
 - Every new recipient → (manual) search for tissue

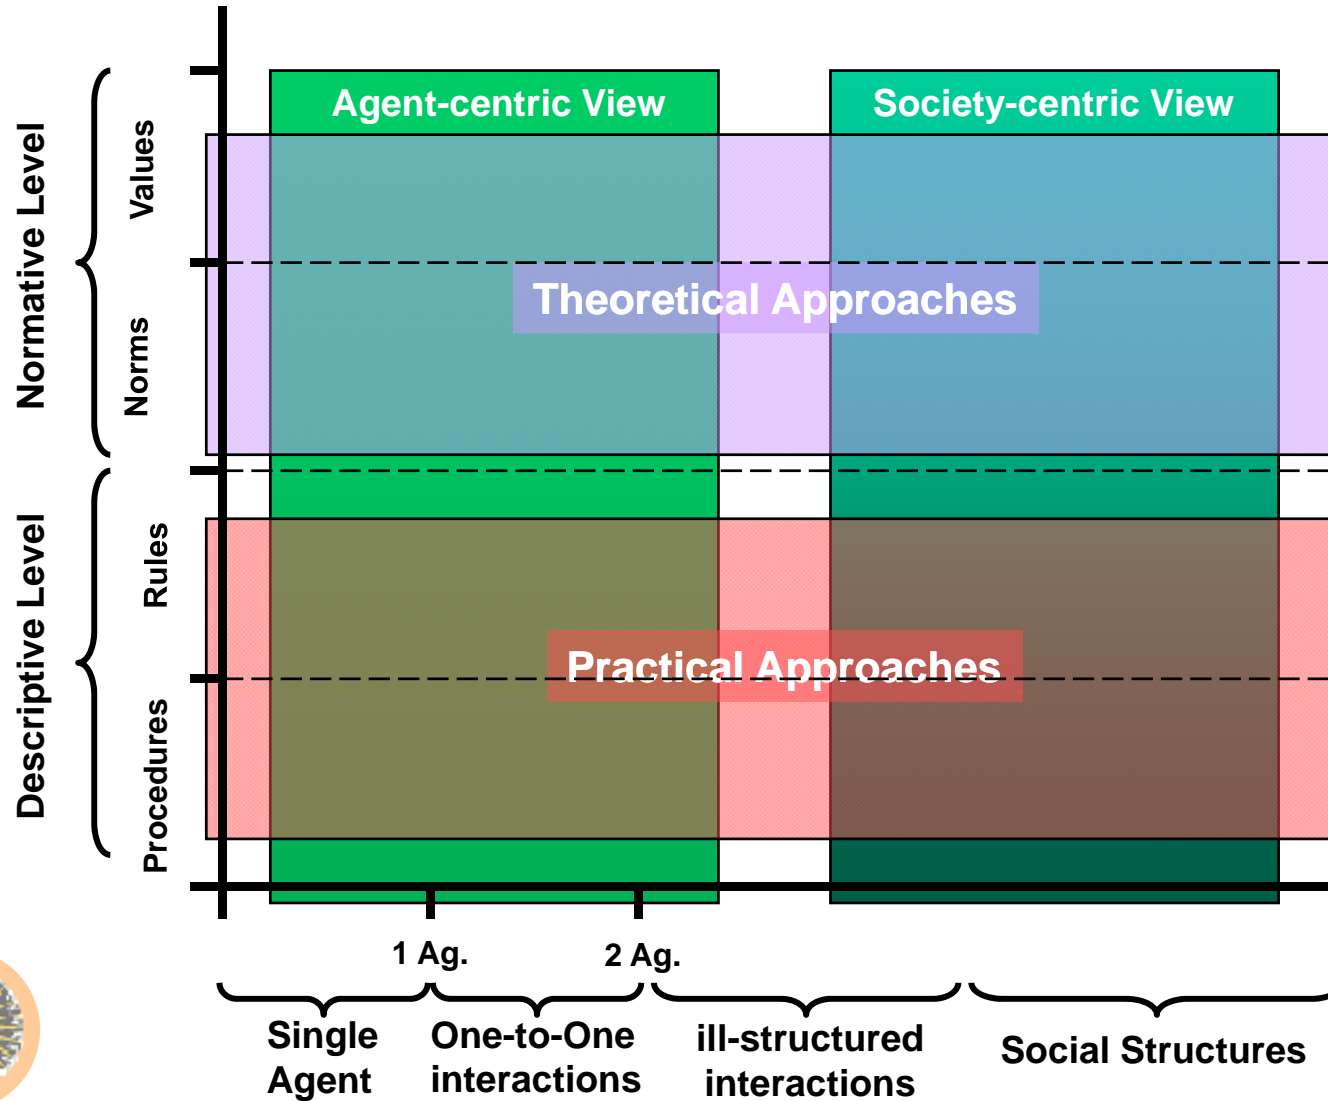

Motivation (VII)

Application in a highly regulated *eHealth* environment

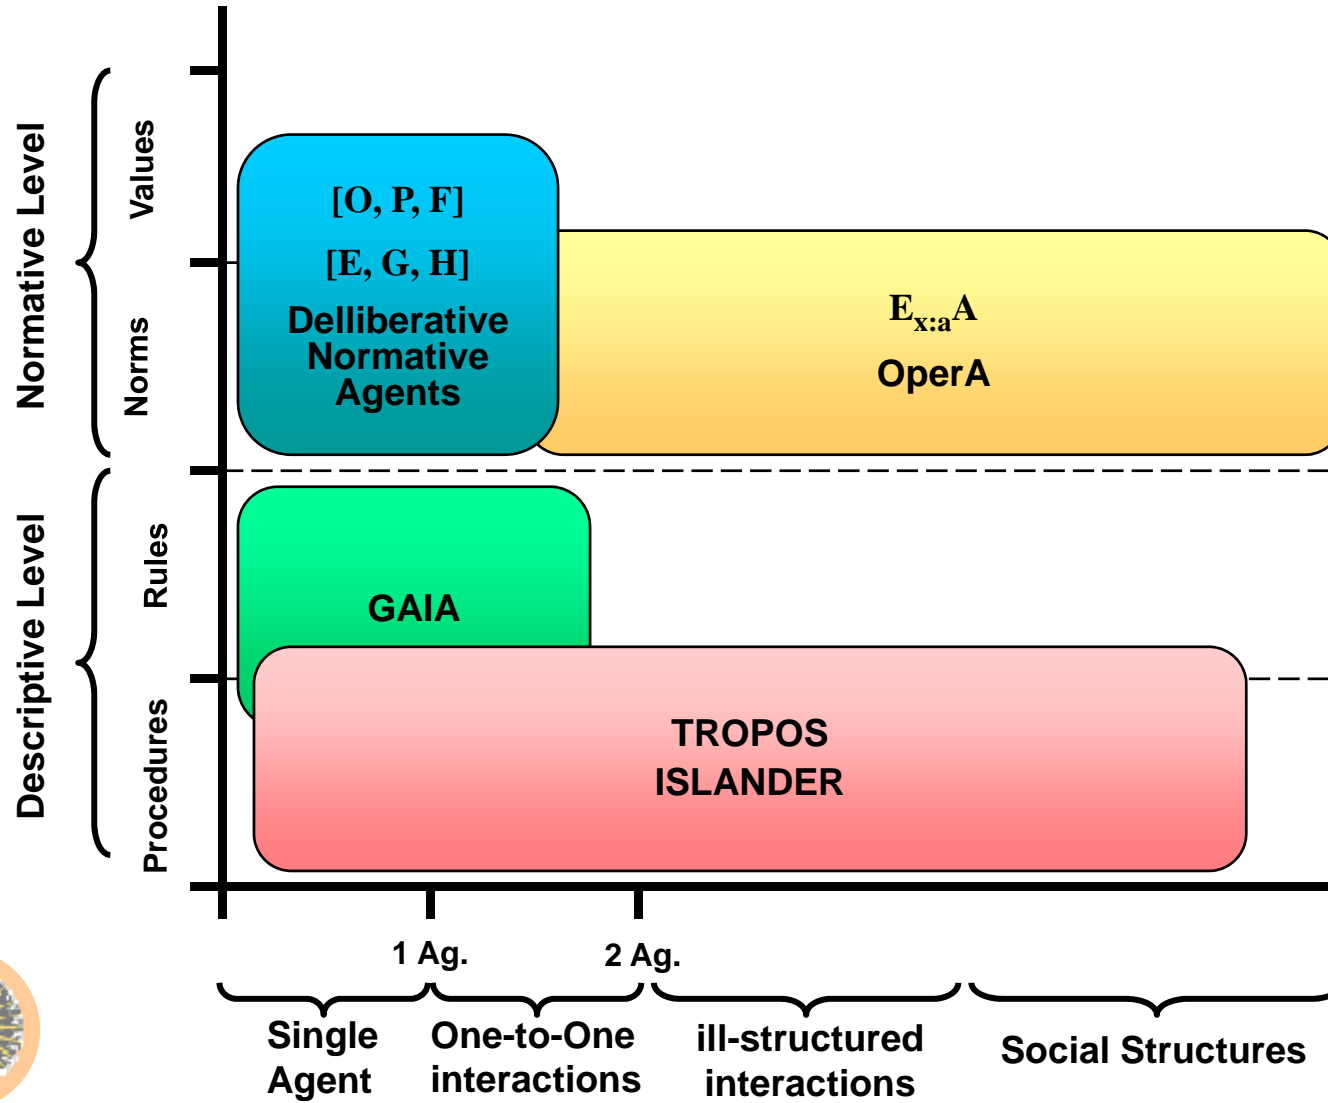

- Scarcity of donors → international coalitions → distributed environment
- Need of a **distributed software solution** to:
 - *Data exchange problem:*
 - *Communication problem:*
 - *Coordination issues:*
 - *Variety of regulations:*

State of the Art (I)

State of the Art (II)

Objectives

- To present a **normative framework** to fill the gap between theoretical and practical approaches:
 - identify the different **abstraction levels** involved in a normative framework
 - define a **connection** between abstraction levels
 - identify the **influence of context** for each abstraction level
- To propose a **standard terminology** to refer to the concepts:
 - *institutions, e-institutions, organizations, e-organizations, abstract norms, concrete norms, rules...*

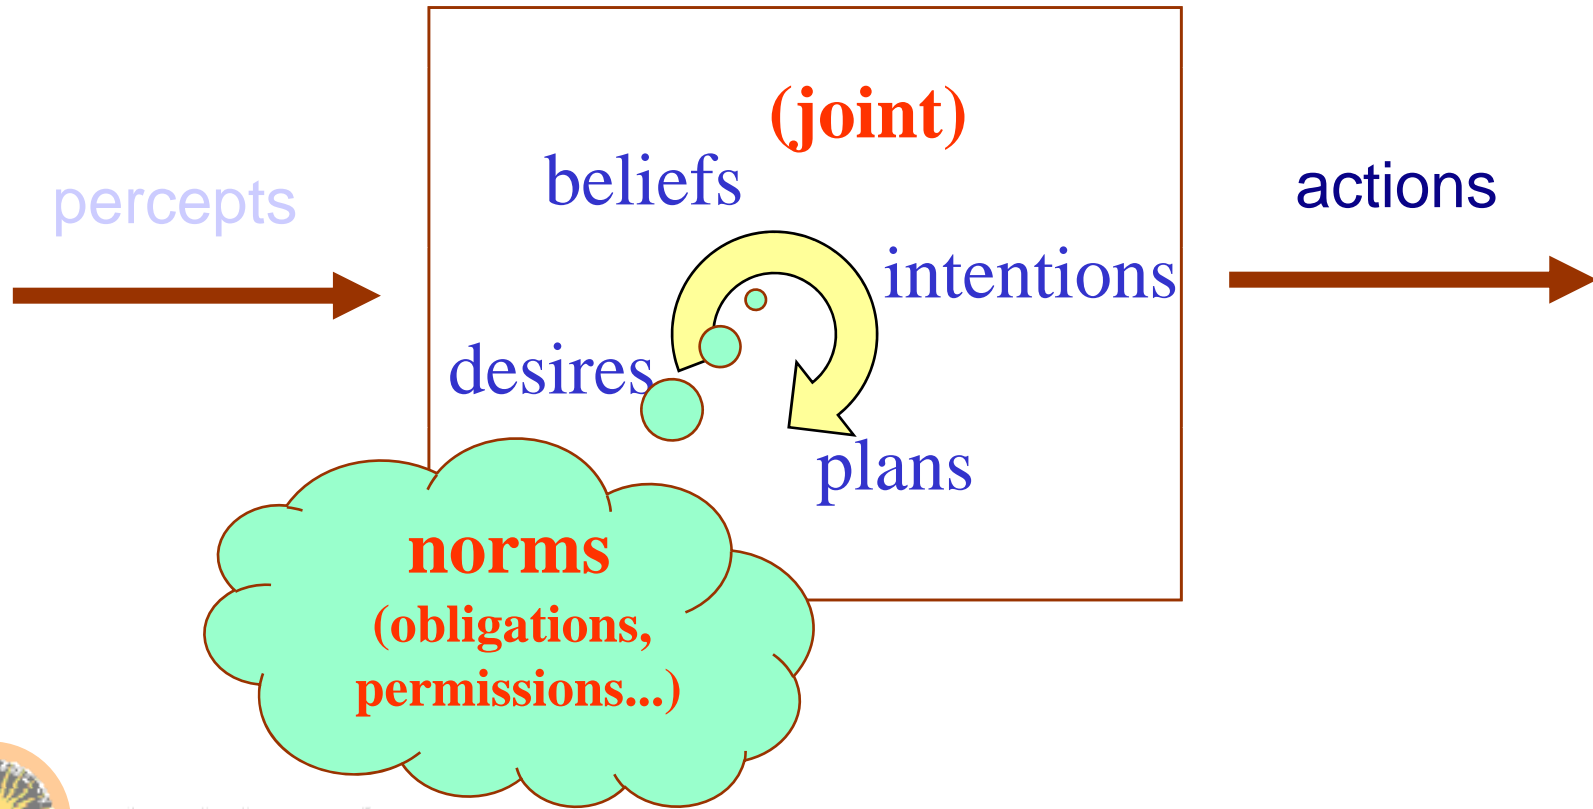

Norms and Agents

Norms and Agents (I)

Influence of norms in the BDI deliberation cycle

Norms and Agents (II)

- How do norms influence the behaviour of the agent?
 - Agent has **no knowledge** about norms
 - Norms are **built-into** the agent's code
 - Norms are **built-into** the plans and protocols the agent uses
 - Norms are **explicit** elements in the agent's reasoning
 - Agent may or may not **adopt** the norms
 - Agent may or may not **follow** the norms
 - agent **follows** the norm **whenever possible**
 - agent **violates** the norm **sometimes**
 - agent **violates** the norm **always if possible**

Norms and Agents (III)

- Most of the approaches talk about **norms**, but a close-up look shows that they are working at completely different **levels of abstraction**
- **Idea**: there are **several levels of abstraction** involved in a normative system
- **Objectives**: to identify these levels and define an standard terminology.

Agent view (I)

Agent view (II)

- **Problem:** in this model interpretation of norms is completely done by the agents.
 - How to ensure that two agents that play the same role have similar sound interpretations of the norms that apply to them?
- **Solution:** to fix part of the interpretation in a given context.

- Idea: Agents do not have a relation with the WHOLE world but a part → **context** of an agent.

Agent view (III)

- A **Context** is a set of worlds with a shared vocabulary and a normative framework
- Effects on the Normative Dimension
 - The generic norms applied to the world as a whole are called **Abstract Norms**.
 - **Concrete Norms** are interpretations of the abstract norms in a given context

javier@cs.uu.nl

Agent view (IV)

*e*Organizations and Norms

Universiteit Utrecht

javier@cs.uu.nl

Organizations and Norms

- Norms describe which states/actions within the e-organization should **ideally** take place
- Norms are too abstract to be directly translated into procedures (plans/protocols) in a single step
- **Idea:** to identify the different **levels of abstraction** from the e-organization perspective
- Organizations hardly work in isolation
- **Idea:** to identify how the organization's surrounding **context** influences the different levels

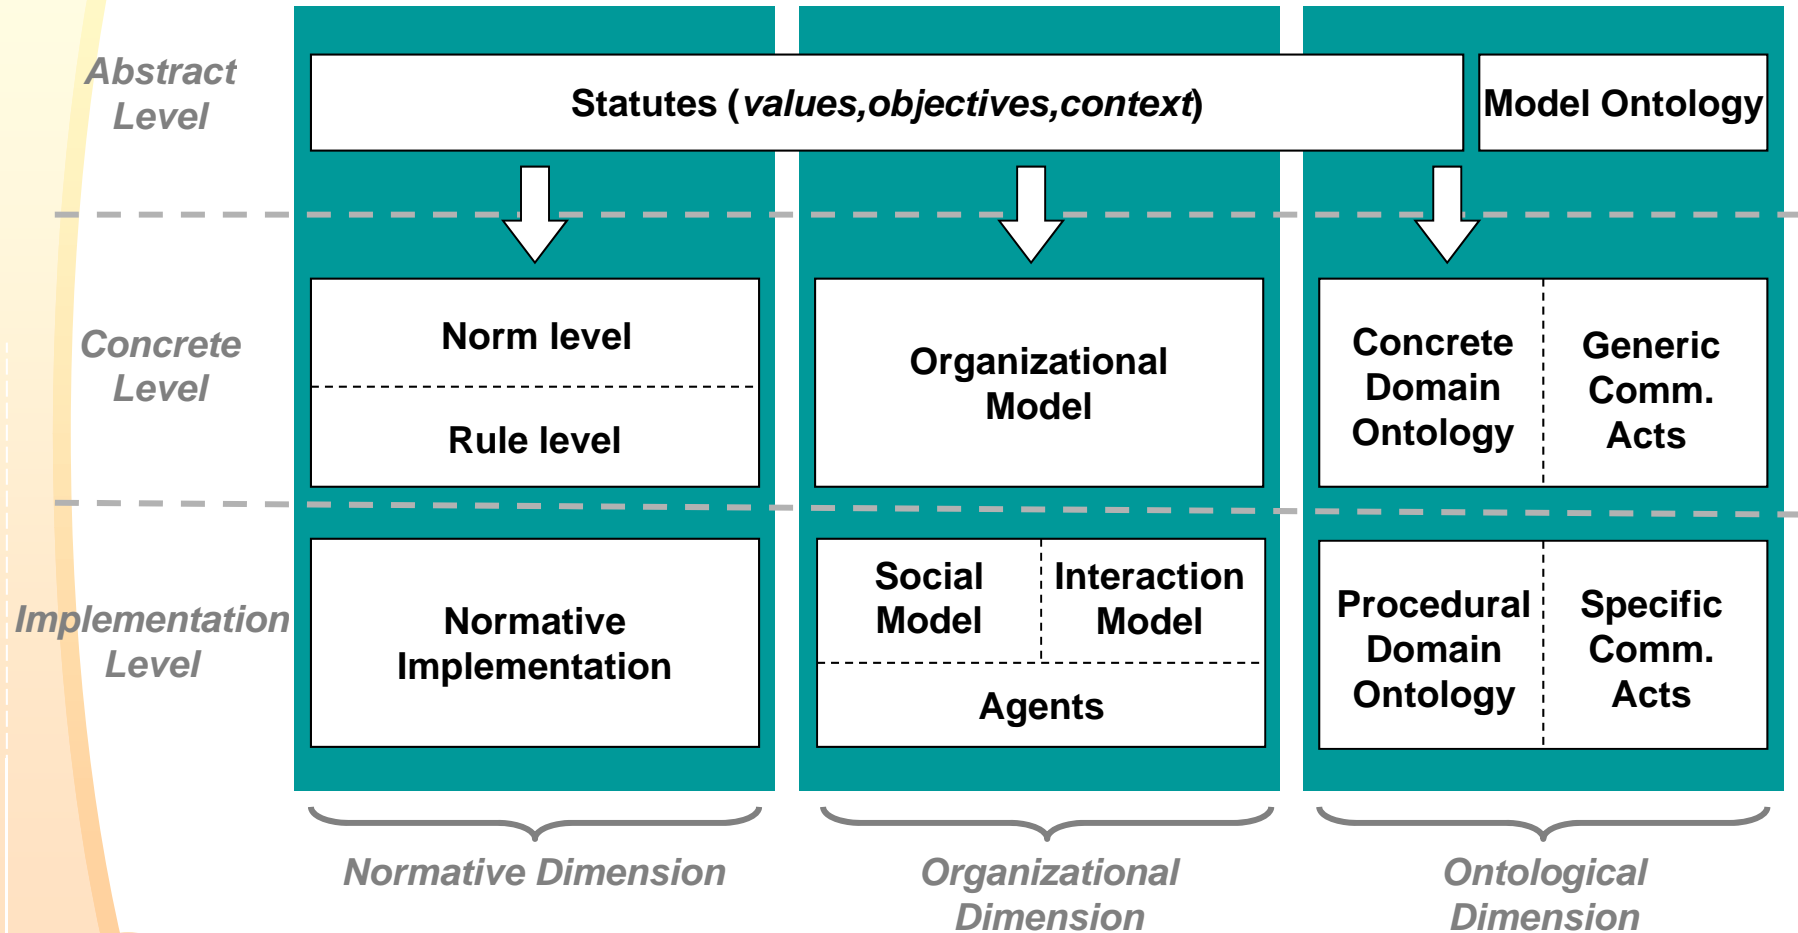

The HARMONIA framework

- Main Objectives
 - To identify the different levels in a Normative System
 - To find a (formal) connection between levels
- The framework identifies two kinds of elements
 - Horizontal elements: 3 levels (Abstract, Concrete and Normative Implementation)
 - Vertical elements: Policies, Roles, Ontology, Context and Background Knowledge

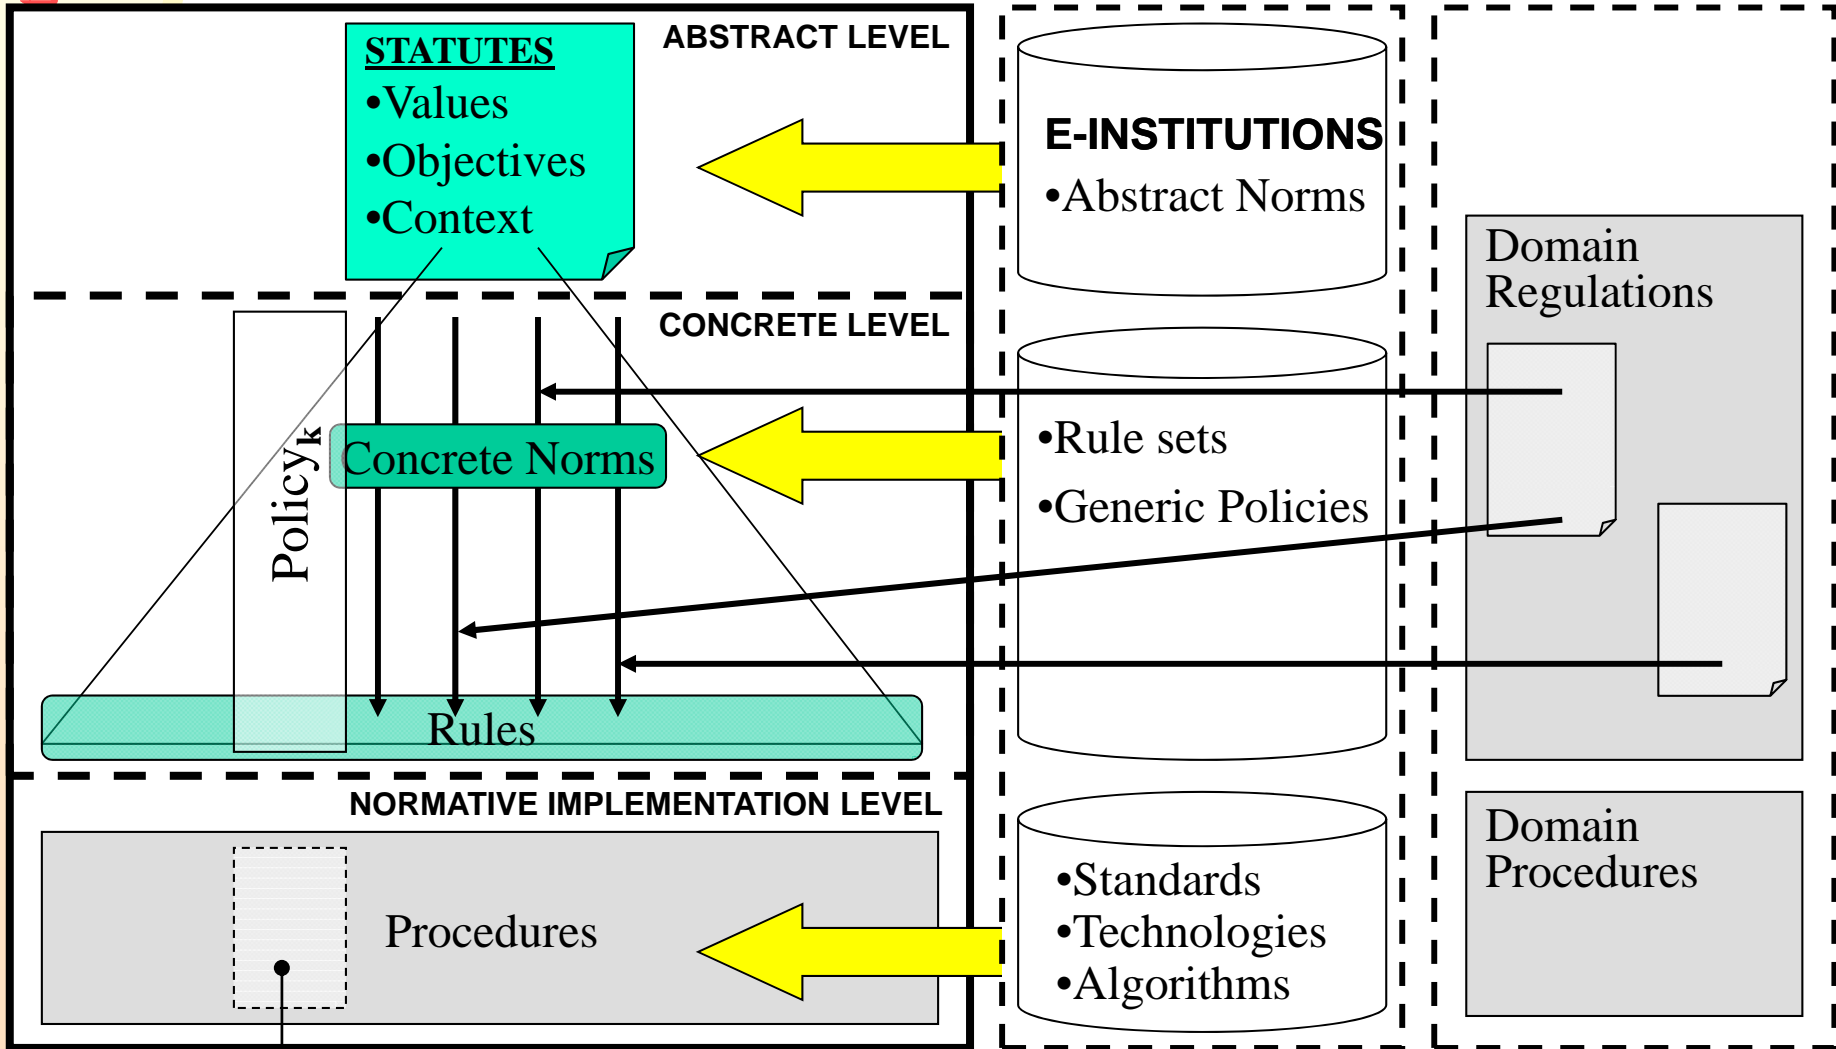

The HARMONIA framework inside OMNI

E-ORGANIZATION

BACKGROUND KNOWLEDGE

CONTEXT

Policy implementation

Abstract Level: Statutes

The statutes of organizations define the

- Values
- Objectives
- Context

of the organization at the most abstract level.

Example: Organización Nacional de Trasplantes:

The **main objective** of ONT is to **increase the number of organ donations** and the subsequent increase in available organs for transplants.

The ONT **operates according to the regulation of the national health system** and it strives to distribute the donated organs in the most **appropriate and correct** way according to the current technical knowledge and according to the **ethical principles of equality**.

Abstract Level: Abstract Norms (I)

From Values to Abstract Norms

- **Values** are beliefs that we have about what is important and thus about how things should be.
 - *“Appropriate distribution”*
 - *“Distribution according to ethical principles of equality”*
 - *“Fairness of transaction”*
 - *“Respect privacy of persons”*
- **Values** can be considered as the most abstract level on which norms are expressed.
- The values of an organization can be defined by the set of **Abstract Norms** specified within the org. that contributes to that value

$$D(\text{equity}) ::= \{ F(\text{discriminate}(x,y,\text{age})), \\ O(\text{find_best_recipient}(\text{organ})), \\ \dots \}$$

Abstract Level: Abstract Norms (II)

- Norms are **abstract** if they use concepts that are not fully described in the organization's ontology.
 - *“It is forbidden to discriminate based on age”*
- Norms can be **abstract** in the following ways:
 - They refer to an **abstract action**
 - They use **terms** that are **vague**
 - They abstract from **temporal aspects**
 - They abstract from **agents** and or **roles**
 - They refer to actions or situations that are **not** (directly) **controllable** and/or **verifiable** by the organization

Abstract Level: Abstract Norms (III)

- example 1: Abstract actions

*“a living donor should **consent** to the donation of an organ”*

$$\left. \begin{array}{l} \text{sign}(\text{donor}, \text{contract}) \cup \text{carry}(\text{donor}, \text{will}) \cup \\ \text{tell}(\text{donor}, \text{family}) \end{array} \right\} \Rightarrow_{\text{ONT}} \text{Consent}(\text{donor})$$

- example 2: Vague terms

*“the ONT is obliged to ensure that the distribution of organs and tissues is **appropriate**”*

$$\left. \begin{array}{l} O_{\text{ONT}}(\text{ensure_quality}(\text{organ})) \wedge \\ O_{\text{ONT}}(\text{ensure_compatibility}(\text{organ}, \text{recipient})) \end{array} \right\} \Rightarrow_{\text{ONT}} O_{\text{ONT}}(\text{appropriate}(\text{distribution}))$$

Abstract/Concrete Level

Representing Norms

- Formal representation of norms needed
- Which logic?
 - Abstract and Concrete Norms permit, oblige or prohibit
 - Concrete Norms may be conditional
 - Concrete Norms may have temporal aspects
 - Concrete Norms are relativized to roles

→ variant of Deontic

```

ONT:C1.1.1      OONT(ensure_quality(piece) < do(assign(piece, recipient)))
ONT:C1.1.1.1    Oorigin_org(ensure_quality(piece))
ONT:C1.1.1.1.1  Ohospital(ensure_quality(organ))
ONT:C1.1.1.1.2  Otissue_bank(ensure_quality(tissue))
ONT:C1.1.1.2    OCARREL(get_quality(piece, origin_org)
                < do(assign(piece, recipient)))
ONT:C1.1.1.2.1  OCARREL(get_quality(organ, hospital)
                < do(assign(organ, recipient)))
    
```

Concrete Level: Concrete Norms

- Concrete norms are the result of translating the abstract norms in the context of the organization into norms that make use of **terms** and **actions** that are defined in the organization's ontology.

$$O_{\text{hosp}}(\text{consent}(\text{donor}(p,x)) < \text{done}(\text{transplant}(\text{hosp},x,p,q)))$$

- **Problem:** HOW is a concrete norm like this implemented in an e-Organization?

Concrete Level: Rules (I)

- Translation from **Normative** dimension to a **Descriptive** one
 - Idea: reduction from **Deontic Logic** to **Dynamic Logic**
[J.-J. Meyer]

$$O_{\text{hosp}}(\text{consent}(\text{donor}(p,x)) < \text{do}(\text{transplant}(\text{hosp},x,p,q)))$$

$$[\text{transplant}(\text{hosp},x,p,q)]\text{done}(\text{consent}(\text{donor}))$$
$$O_{\text{buyer}}(\text{pay}(\text{goods},\text{seller},\text{price}) < \text{do}(\text{exit}(\text{buyer})))$$

$$\text{not}(\text{done}(\text{pay}(\text{goods},\text{seller},\text{price}))) \rightarrow [\text{exit}(\text{buyer})]V(\text{fine}(\text{buyer}))$$

Concrete Level: Rules (II)

- Rules, Violations and Sanctions
 - Violation rules define violations
 - A violation is composed by

- pre-conditions
- sanction
- side effects

Violation:	<i>CRL:V18.1</i>
Pre-conditions:	$(done(deliver(organ, hospital_1, hospital_2)) \wedge is_time(t) \wedge done(wait_for(is_time(t + 1\ day)))) \wedge \neg done(hospital_2.send(result_transplant))$
Sanction:	$\{request(hospital_2, send(organ, result_transplant)); inform(board, precondition)\}$
Side-effects:	$\{record(\neg done(precondition), incident_log)\}$

- Pre-conditions are used by Police Agents to detect violations.
- Sanctions are used by Flexible Normative Agents to reason about the utility of breaking the related rule.
- Side effects are used by internal agents to recover the system from the violation.

Normative Implementation Level (I)

- Idea: the final implementation of the system
- two options (non-exclusive!):
 - To have an interpreter that can “read & execute” directly the formulae in the rule level.
 - To translate the formulae into concrete protocols programmed in a standard programming language
 - defining **constraints** on procedures to guarantee the respect of norm
 - defining **triggers** on violation of norms to prevent a violation

Flexible Normative Agents

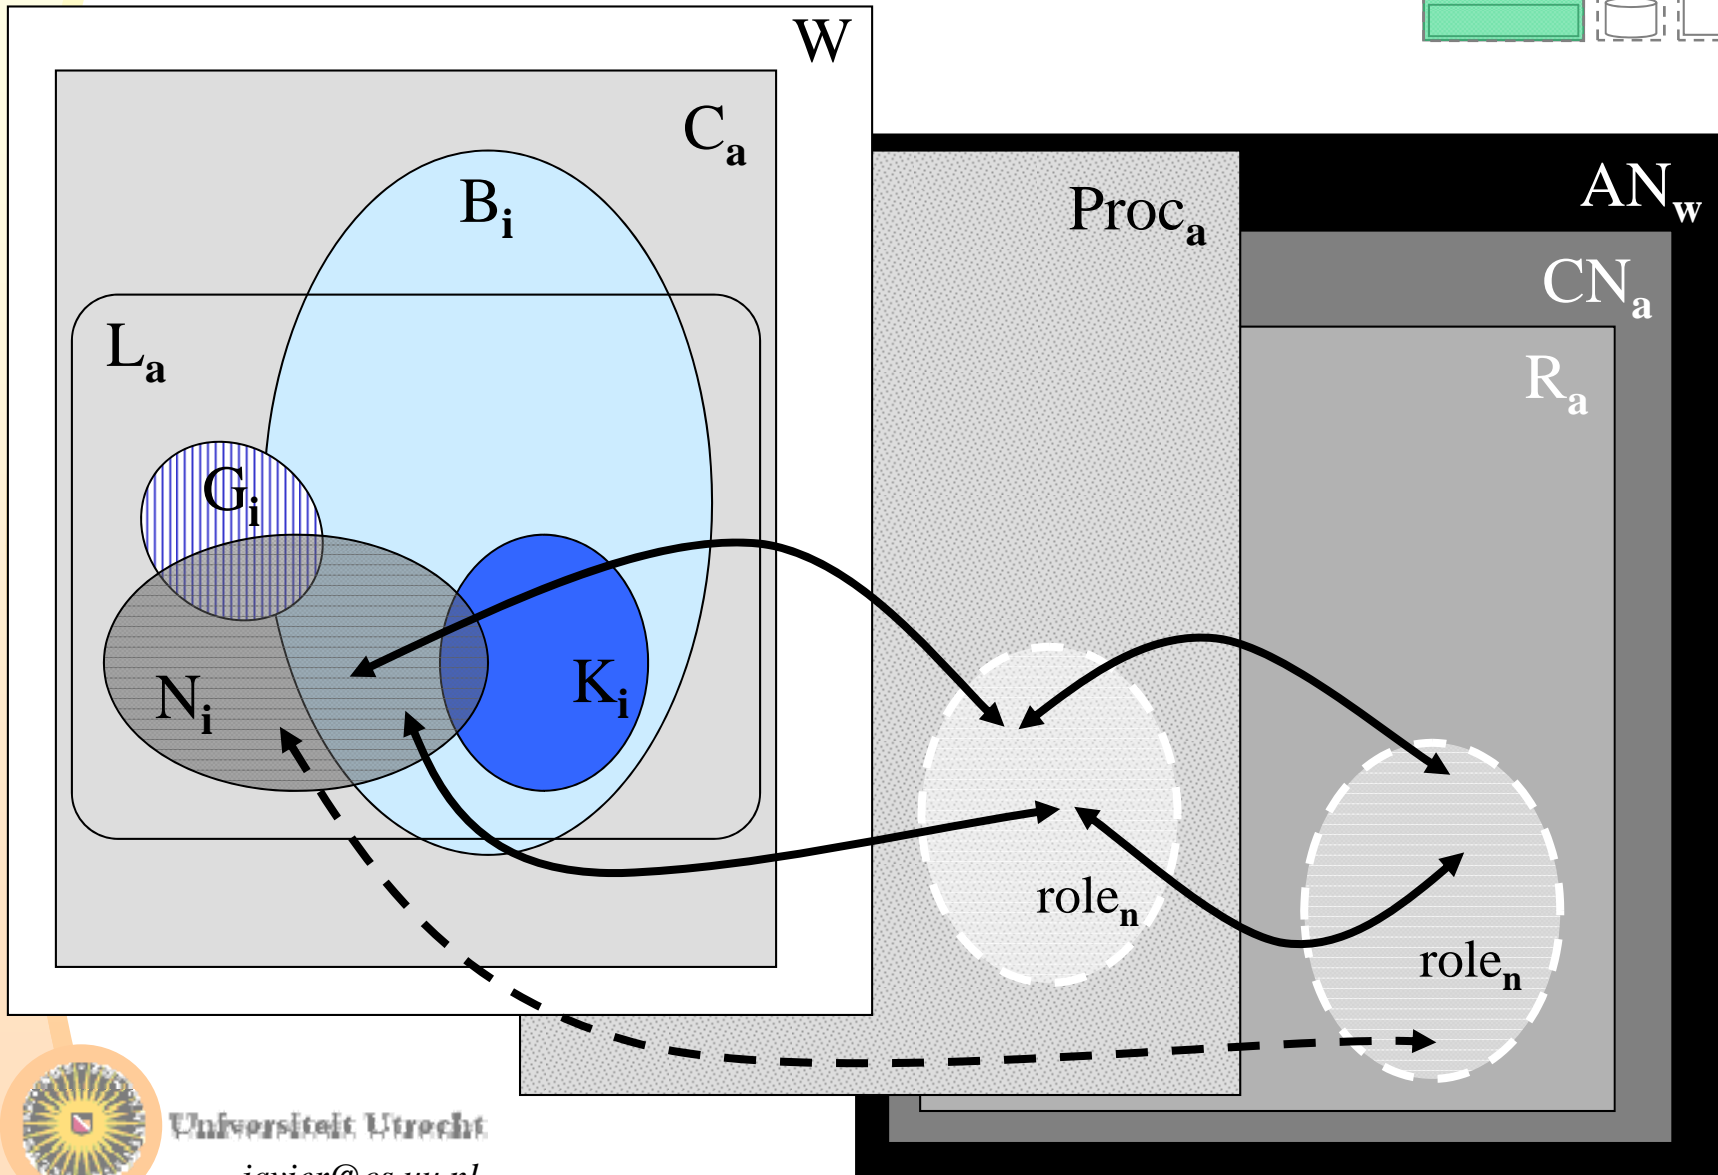

(able to interpret rules and protocols)

Standard Agents

(able to choose and follow protocols)

Normative Implementation Level (II)

Example

ABSTRACT LEVEL

$D(\text{appropriate}(\text{distribution}))$

$O_{\text{ONT}}(\text{appropriate}(\text{distribution}))$

(CONCRETE) NORM LEVEL

$O_{\text{ONT}}(\text{ensure_appropriateness}(\text{organ}, \text{recipient}) < \text{do}(\text{assign}(\text{organ}, \text{recipient})))$

$O_{\text{CARREL}}(\text{ensure_appropriateness}(\text{organ}, \text{recipient}) < \text{do}(\text{assign}(\text{organ}, \text{recipient})))$

RULE LEVEL

$[\text{assign}(\text{organ}, \text{recipient})] \text{done}(\text{ensure_appropriateness}(\text{organ}, \text{recipient}))$

NORMATIVE IMPLEMENTATION LEVEL

`ensure_appropriateness(o, r)`

`assign(o, r)`

Univ

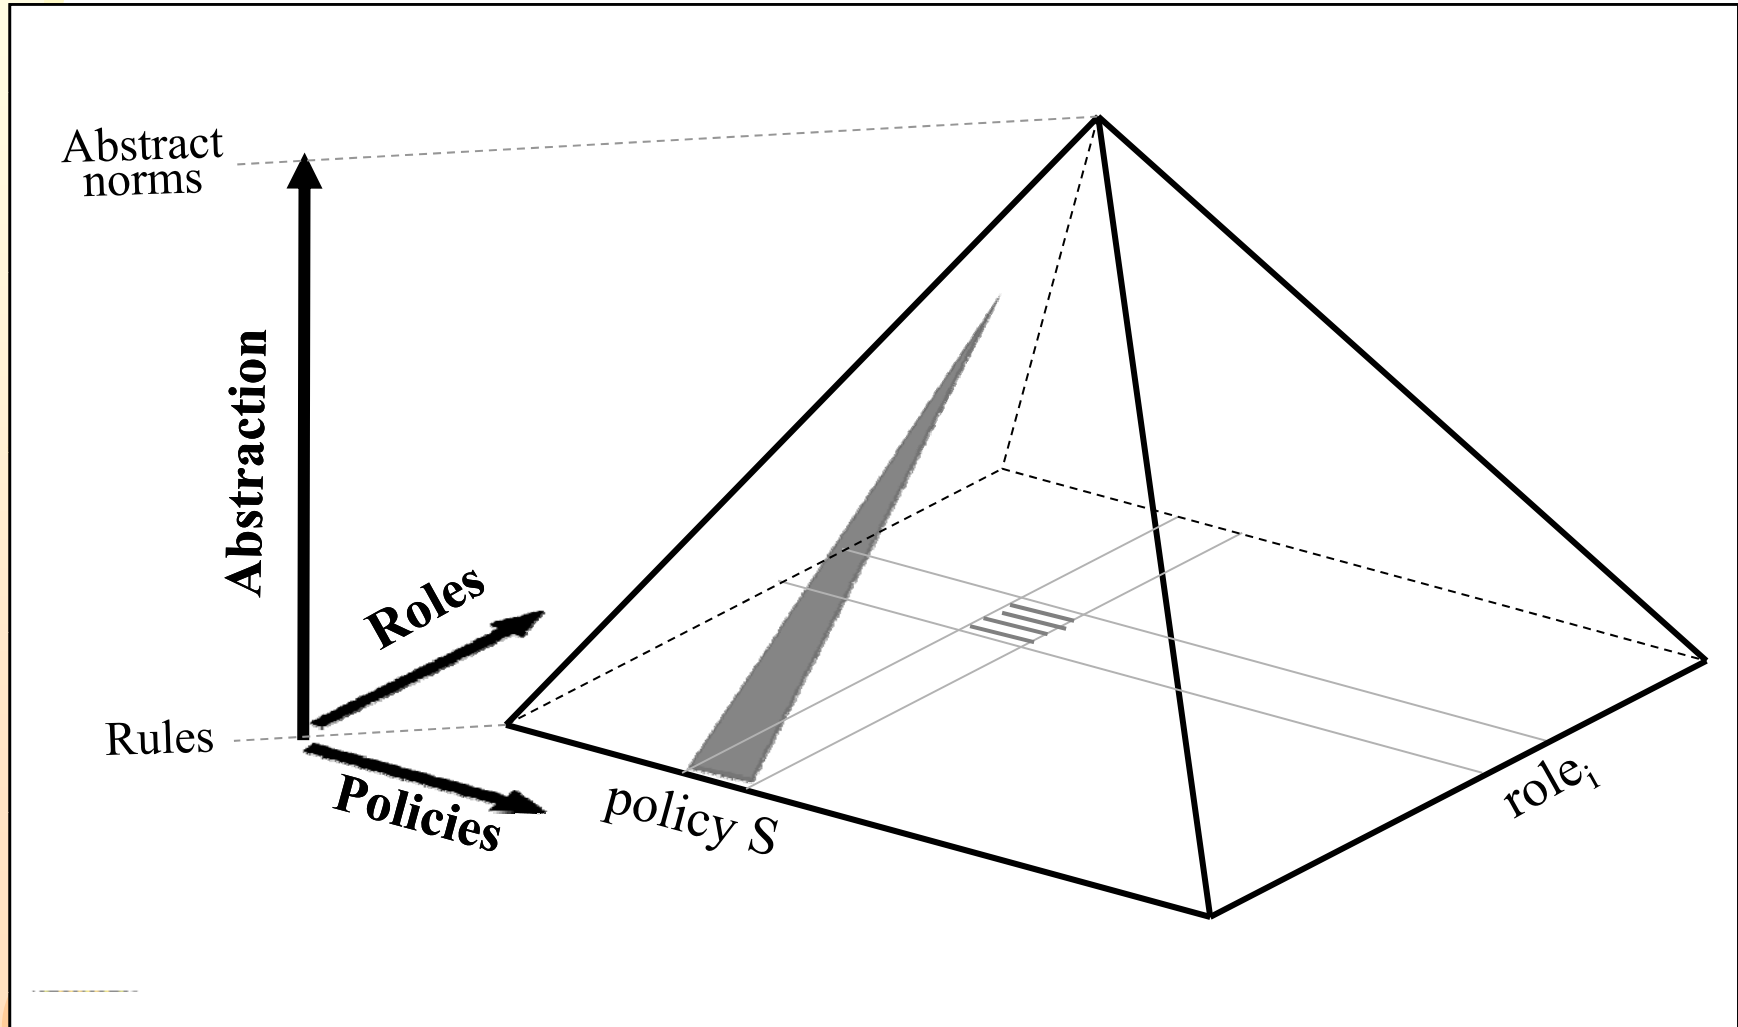

javier@cs.uv.es

All levels: Policies

- There are several definitions of **Policy**
 - Policies as **low-level plans** or protocols
 - Policies as **values or aims** of the organization
 - Policies as **high-level plans**, relating organizational aims with procedures
- **Policies** are vertical elements, linking organization's **values** with the related **norms** and **rules** to the final **implementation**
 - e.g.: *allocation policy, security policy*

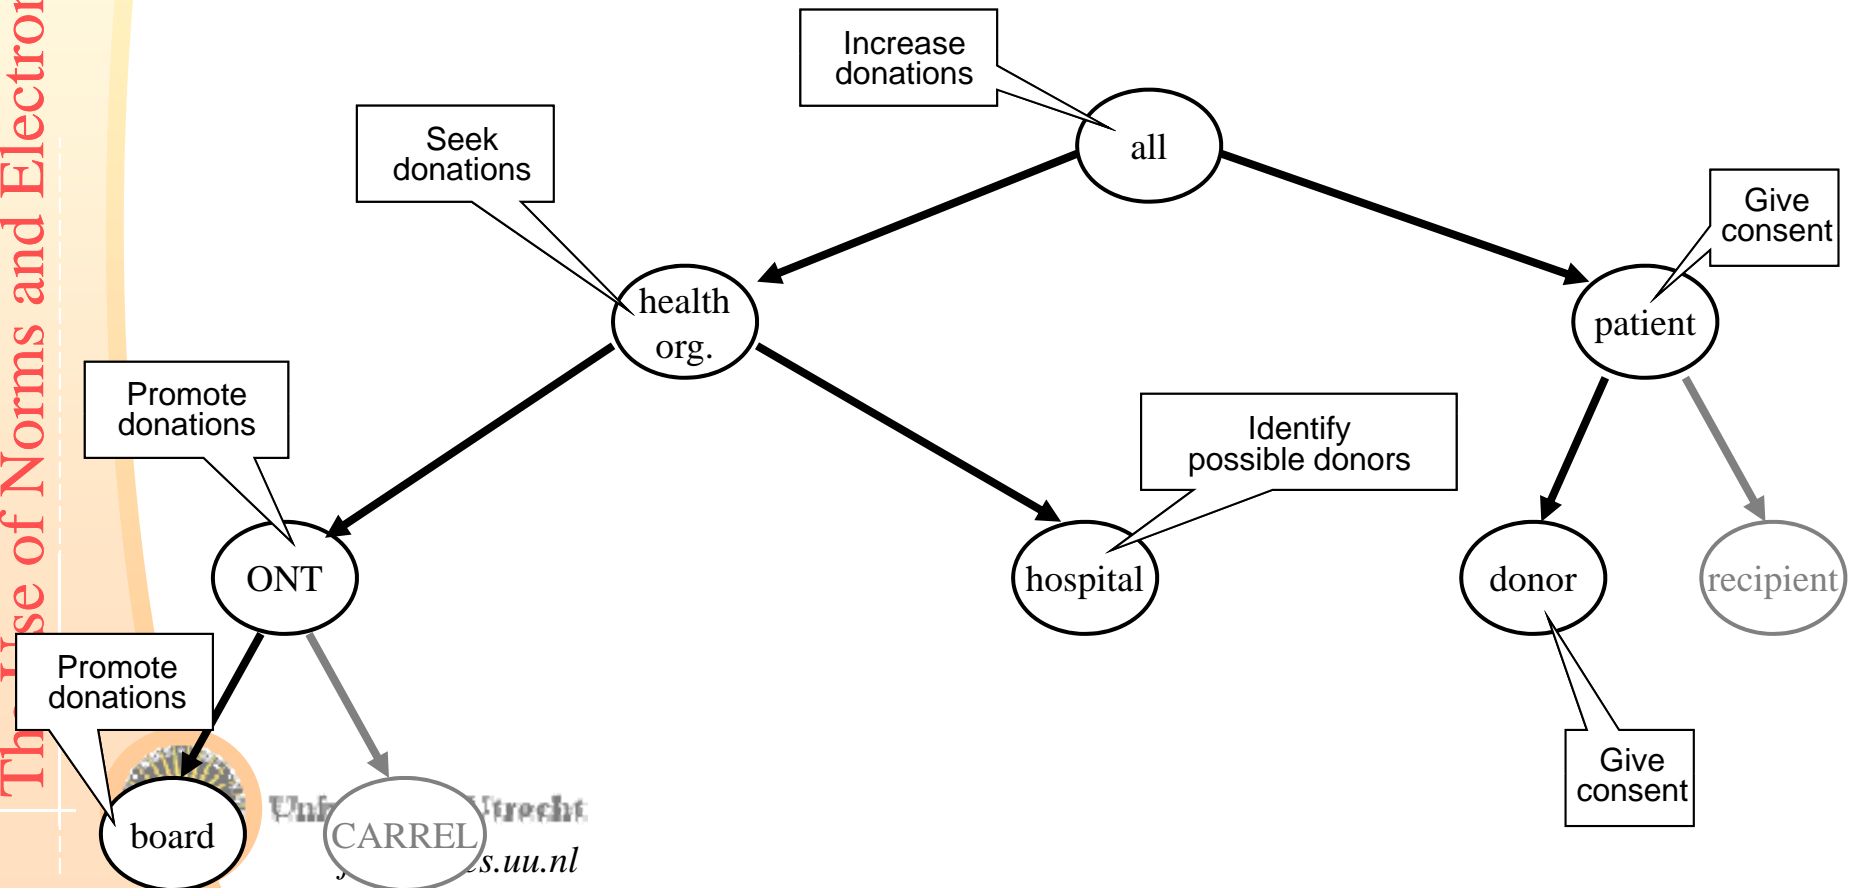

All levels: Roles (I)

All levels: Roles (II)

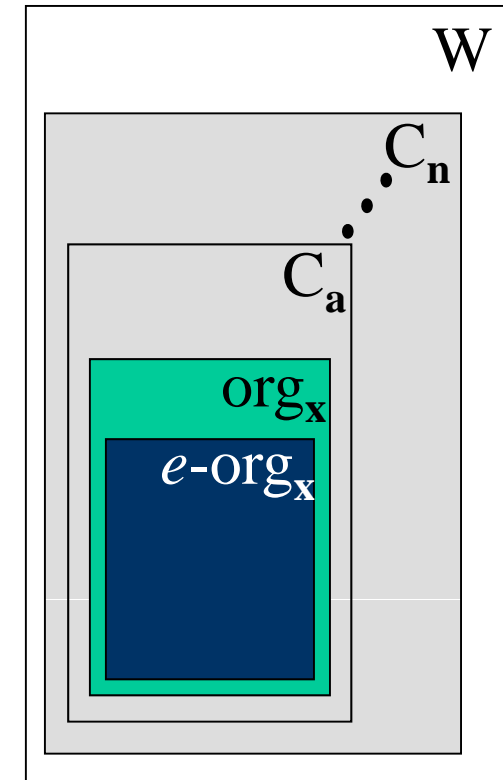

- Role definition guided by goal distribution
 - Origin: Objectives in Statutes
- Distribution of responsibilities

All levels: Context (I)

- Statutes make reference to a surrounding context
- Links with the idea of nested contexts
 - $e\text{-org}_x$ is a context defining a vocabulary and a normative system
 - there are super-contexts that have an influence in $e\text{-org}_x$ definition
- formal view: influence as interpretation in the subcontext
 - counts-as operator \Rightarrow_s as a link between interpretations
- influence in several levels of abstraction
 - vocabulary (terms, predicates)
 - values, norms, rules and procedures

All levels: Context (II)

ABSTRACT LEVEL

$D(\text{appropriate}(\text{distribution}))$

$O_{\text{ONT}}(\text{appropriate}(\text{distribution}))$

(CONCRETE) NORM LEVEL

$O_{\text{ONT}}(\text{ensure_appropriateness}(\text{organ}, \text{recipient}) < \text{do}(\text{assign}(\text{organ}, \text{recipient})))$

Spanish
National Health
System

$O_{\text{CARREL}}(\text{ensure_appropriateness}(\text{organ}, \text{recipient}) < \text{do}(\text{assign}(\text{organ}, \text{recipient})))$

RULE LEVEL

$[\text{assign}(\text{organ}, \text{recipient})] \text{done}(\text{ensure_appropriateness}(\text{organ}, \text{recipient}))$

NORMATIVE IMPLEMENTATION LEVEL

`ensure_appropriateness(o, r)`

`assign(o, r)`

Univ

javier@cs.uv.es

All levels: Context (II)

ABSTRACT LEVEL

D(appropriate(distribution))

O_{ONT}(appropriate(distribution))

(CONCRETE) NORM LEVEL

O_{ONT}(ensure_appropriateness(organ,recipient) < do(assign(organ,recipient)))

Spanish National Health System

O_{CARREL}(ensure_quality(organ) < do(assign(organ,recipient)))

O_{CARREL}(ensure_compatibility(organ,recipient) < do(assign(organ,recipient)))

RULE LEVEL

[assign(organ,recipient)]done(ensure_quality(organ))

[assign(organ,recipient)]done(ensure_compatibility(organ,recipient))

NORMATIVE IMPLEMENTATION LEVEL

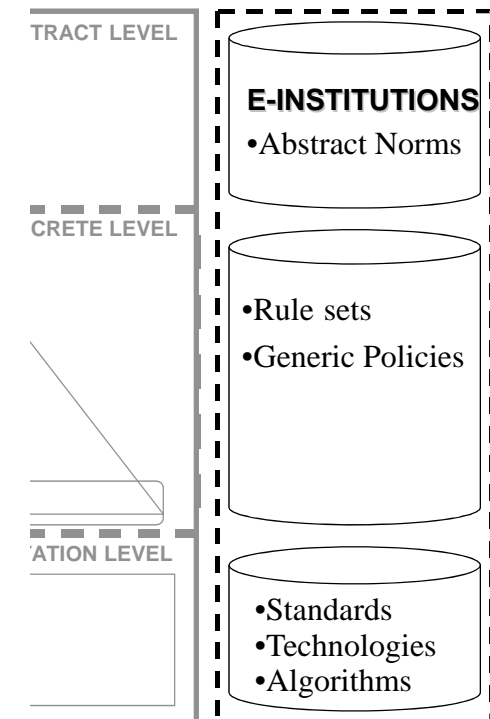

Javier@cs.uv.es

All levels: Background Knowledge

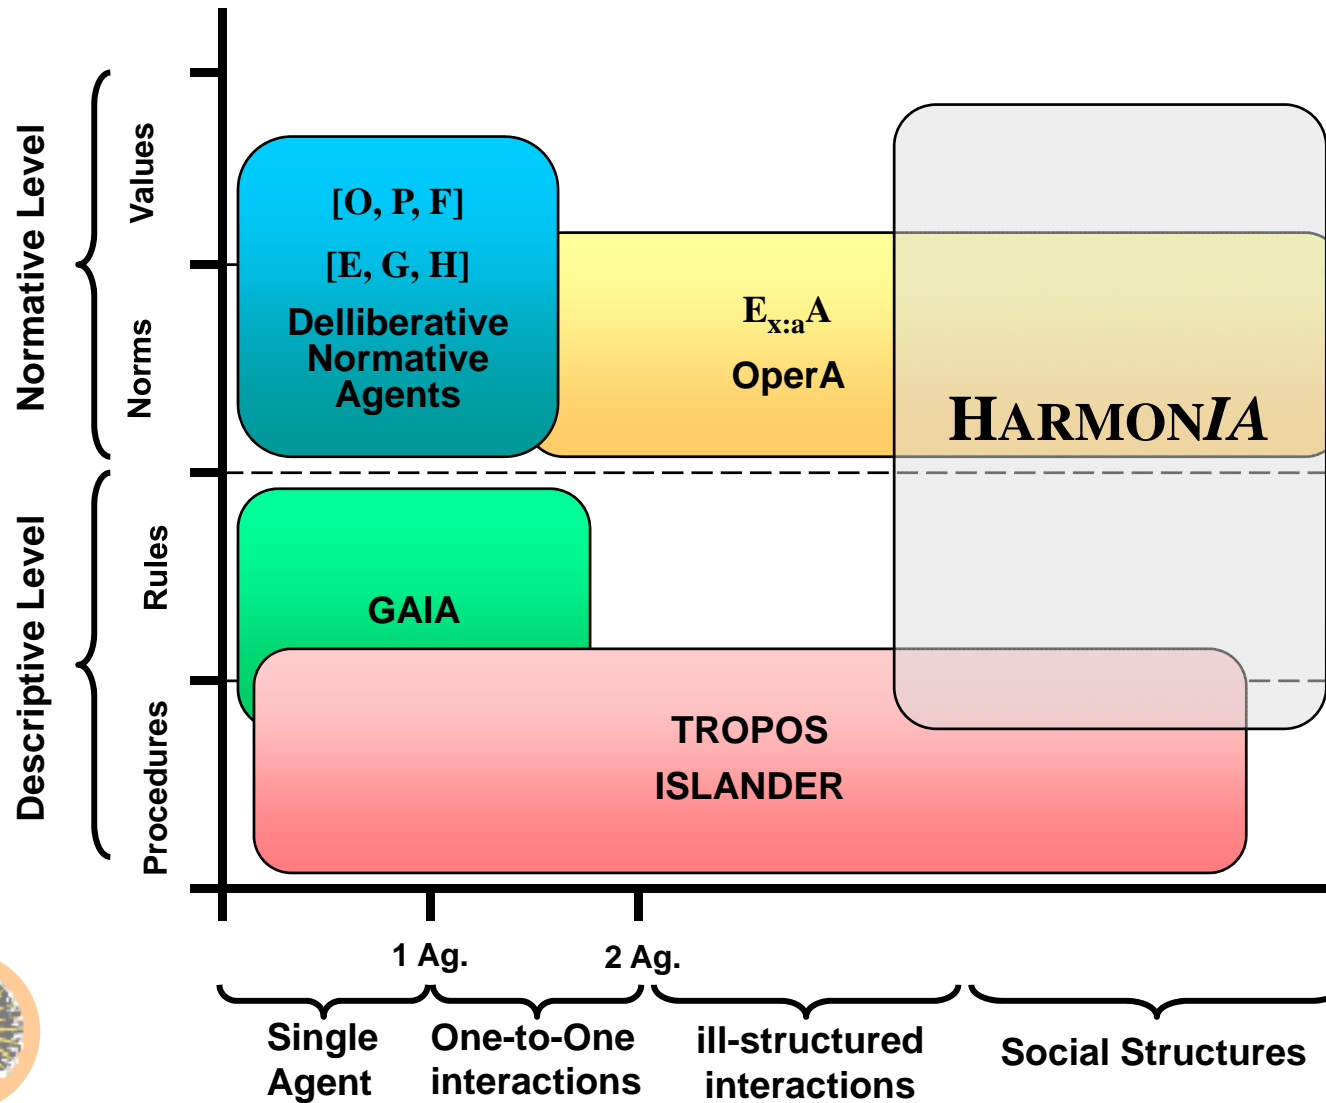

- The **Background Knowledge** is a repository containing templates that can be adapted to create new eOrganizations
 - At the **abstract level**, it provides a collection of abstract norms and the related ontology and abstract roles
 - At the **concrete and rule levels**, it provides templates for some generic policies
 - e.g., the security policy
 - concrete norms, rules and ontology
 - At the **procedure level** it provides a link with the standards, technologies and algorithms needed to implement the policies

- Idea: **e-Institutions** as templates to be *parametrized*, *adapted* or *implemented* to build **e-Organizations**.

HARMONIA and other approaches

Conclusions, Ongoing and Future Work

Universiteit Utrecht

javier@cs.uu.nl

Conclusions

- The design of MAS in complex, open environments can benefit from social abstractions
 - *Coordination, Cooperation and Trust* issues
- An e-Institution is a Social Structure defined by means of norms
- Current approaches are too theoretical or too practical
 - There is a **gap** between the specification of abstract norms and the concrete implementation inside e-Organizations
- We presented **HARMONIA**, a multi-level framework that proposes a formal connection between the different abstraction levels of a Normative System
- We apply **HARMONIA** to a real, complex and highly regulated scenario
 - Distribution of organs and tissues for transplantation purposes

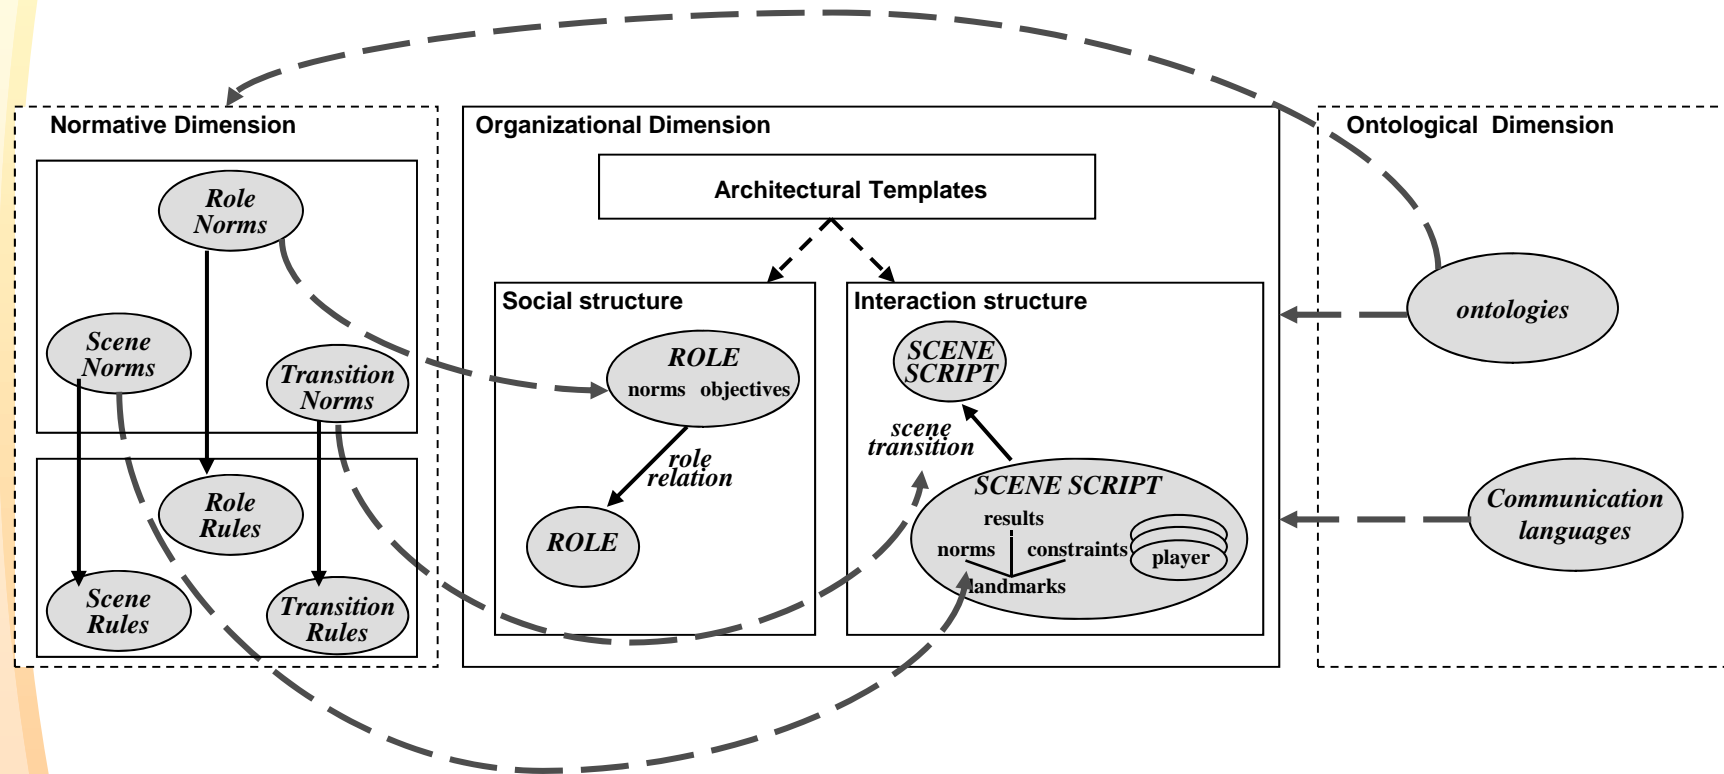

Ongoing and future work (I)

- Creation of **tools for e-Organizations**
 - Tools currently developed in collaboration with Bath.
- Definition of a generic, **modular architecture** for e-Organizations
 - Current work: OMNI
- **Extension** of the theoretical normative framework
 - Sanctions from cumulative violations
 - formalize normative influence dynamics
- Study the use of **other languages/formalisms**
- Application to other **highly-regulated domains**

Ongoing and future work (II)

- OMNI

Ongoing and future work (III)

- Study of dynamic aspects of normative systems

a) change of context

b) consensus

c) collision in context definition
